Previous applications concentrated on topographic 3D elements and multimedia content.

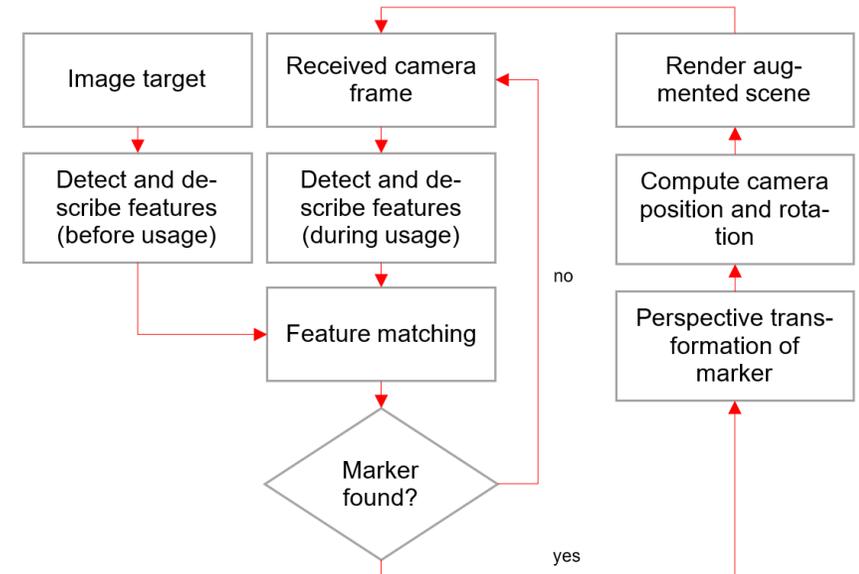

We focus on augmenting maps with thematic 3D elements.

# Implementation: Recognition

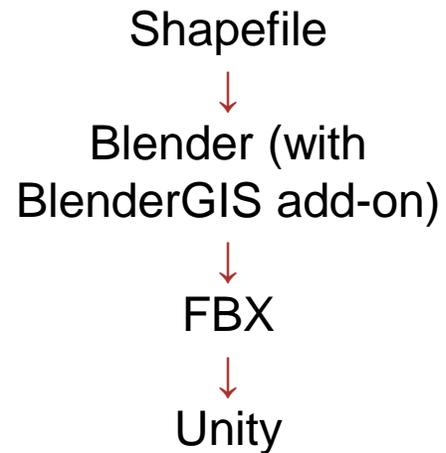

Unity with Vuforia Engine

Recognition workflow

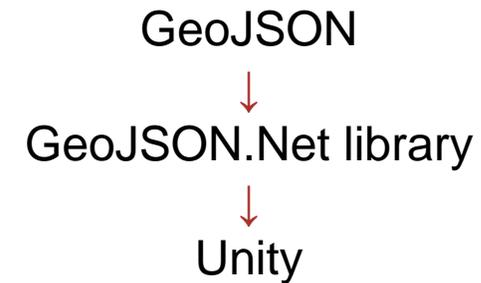

# Implementation: Import of geodata

1<sup>st</sup> attempt

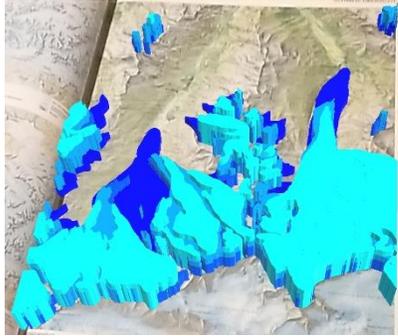

scaling and offset error

2<sup>nd</sup> attempt

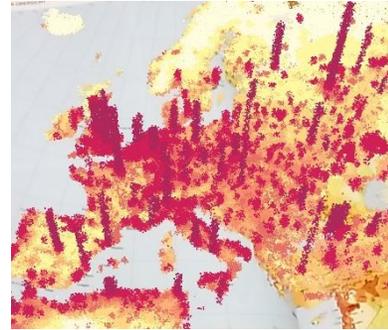

everything ok

# Implementation: 3D visualizations

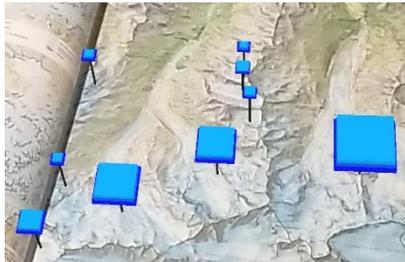

Meshes<sup>1,2</sup> with offset  
for extruded polygons

Meshes with custom shader  
for point cloud

Cube<sup>1,2</sup> for 3D bars

Cube<sup>2</sup> for stacked cuboids

Rotated images<sup>2</sup> for pie charts,  
Cylinders for anchors

LineRenderer for curved lines

1 Animator for extrusion animation

2 Camera.ScreenPointToRay + Physics.Raycast for feature query

# Implementation: User interface

● KARTE ERKANNT

# Evaluation: Setting

Our stand at a Geomatics exhibition

## Participants:

- 56 students from secondary schools
- Average age: 15.6 years
- 37 male, 19 female, 0 diverse

## Materials:

- 2x3 printed atlas maps
- 2 tablets (for AR)
- 2 smartphones (for survey)

# Evaluation: Hypotheses

**H1:** Spatial literacy will be improved by AR.

**H2:** The interest to study a geographic topic will be more encouraged by AR.

**H3:** Sustainable norms and values will be better conveyed by AR.

# Evaluation: Procedure

or

Map

Spatial literacy (H1):  
Assessment task &  
Reflection question

Part I

Thematic interest (H2):  
Assessment task &  
Reflection question

or

Sustainable norms (H3):  
Assessment task &  
Reflection question

Part II

Part I: Printed map  
Part II: Augmented map

or

Part I: Augmented map  
Part II: Printed map

Order

# Evaluation: Part I example

Augmented map:  
Population density

## Spatial literacy (H1) assessment task

State a sparsely and a densely populated area in Europe:

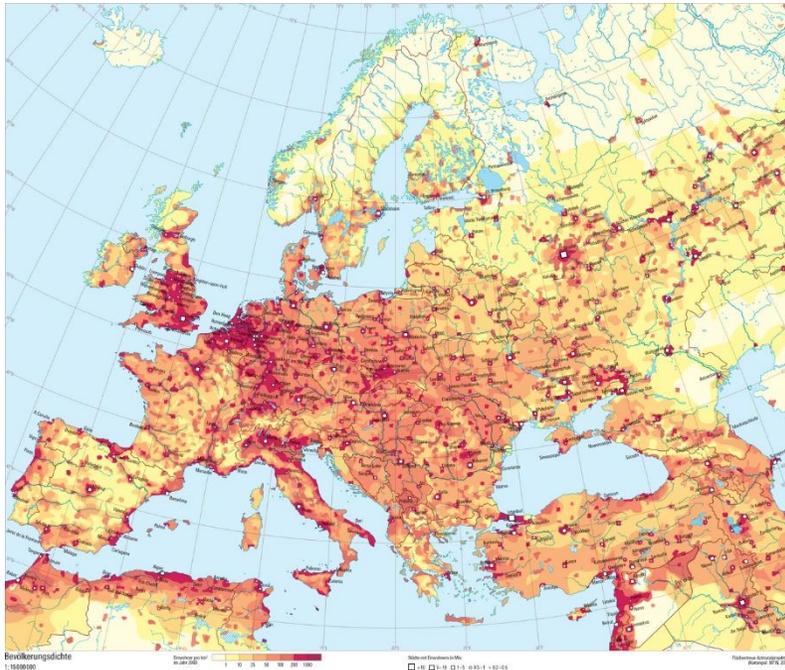

- (a) South of Poland and Iceland
- (b) England and Po valley
- (c) Lapland und the Pyrenees

## Spatial literacy (H1) reflection question

How easy or difficult was it to spatially orientate yourself?

- (a) very easy
- (b) easy
- (c) moderately difficult
- (d) difficult
- (e) very difficult

# Evaluation: Part II example

Printed map:  
Population density

## Thematic interest (H2) assessment task

Explain the difference in peopling of Scandinavia compared to Central Europe:

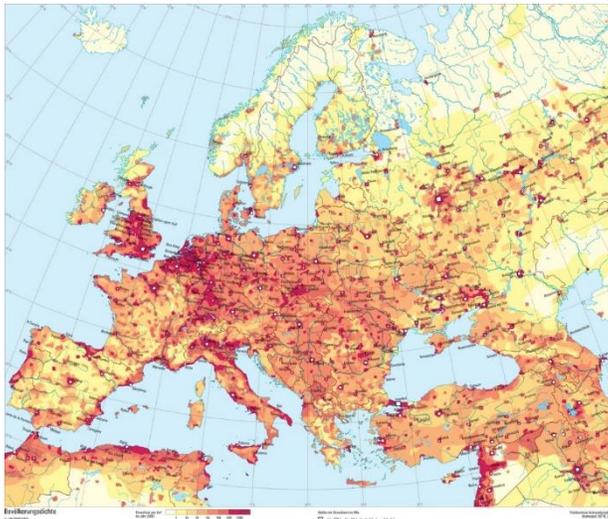

- (a) high emigration number
- (b) small birth rate
- (c) late industrialization

## Thematic interest (H2) reflection question

How interesting or boring was the previously elaborated topic to you?

- (a) very interesting
- (b) interesting
- (c) moderately interesting
- (d) boring
- (e) very boring

# Evaluation: Part II example

Printed map:  
Population density

## Sustainable values (H3) assessment task

Judge the following statement by Johansson, the Swedish minister on integration by means of the population density map "One can also seek asylum in Germany or Denmark. Europe is larger than Sweden":

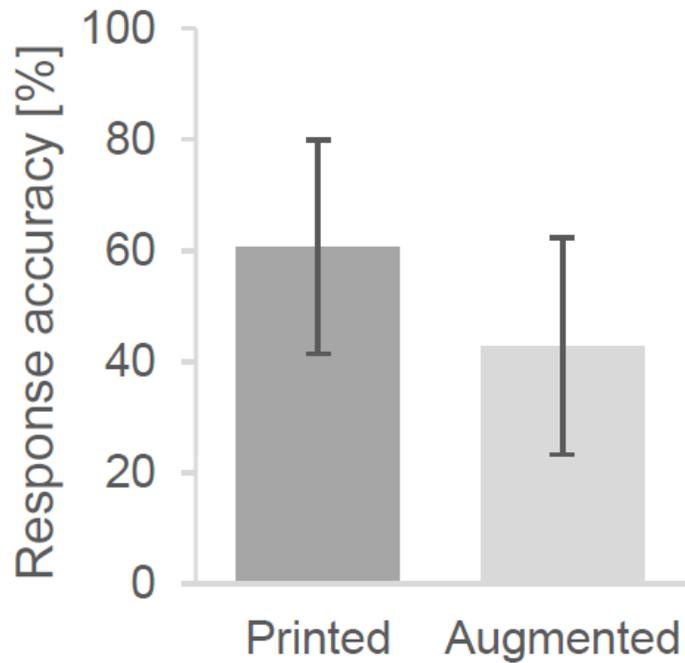

- (a) I agree to the statement according to the population density distribution in Europe.
- (b) In my opinion, the number of inhabitants of a country should not be the only decisive factor for the distribution of asylum seekers.
- (c) Sweden should grant asylum to more people since the country is sparsely populated.

## Sustainable values (H3) reflection question

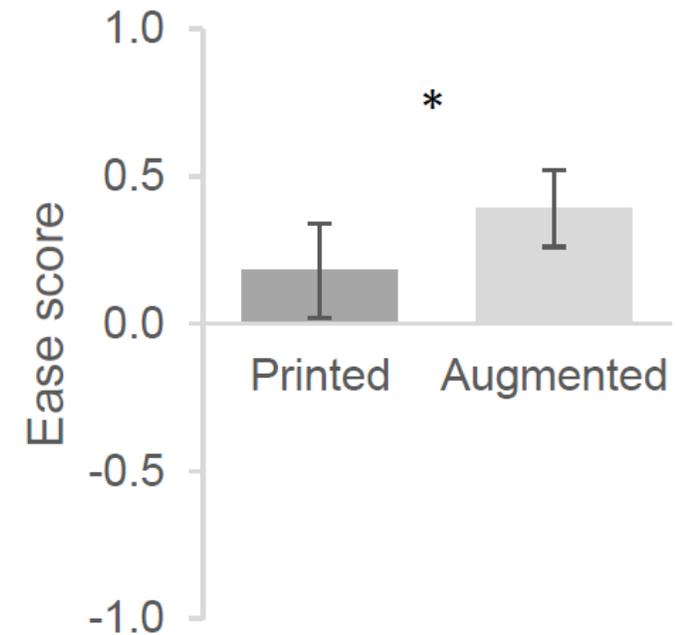

How did your opinion change while working with the map?

- (a) much less sustainable
- (b) less sustainable
- (c) equally sustainable
- (d) more sustainable
- (e) much more sustainable

# Evaluation: Spatial literacy (H1)

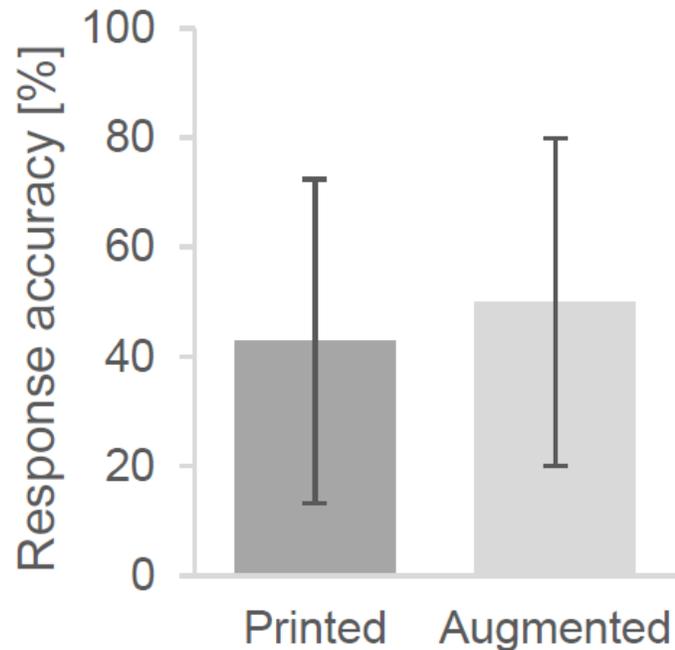

Effectiveness of map analysis

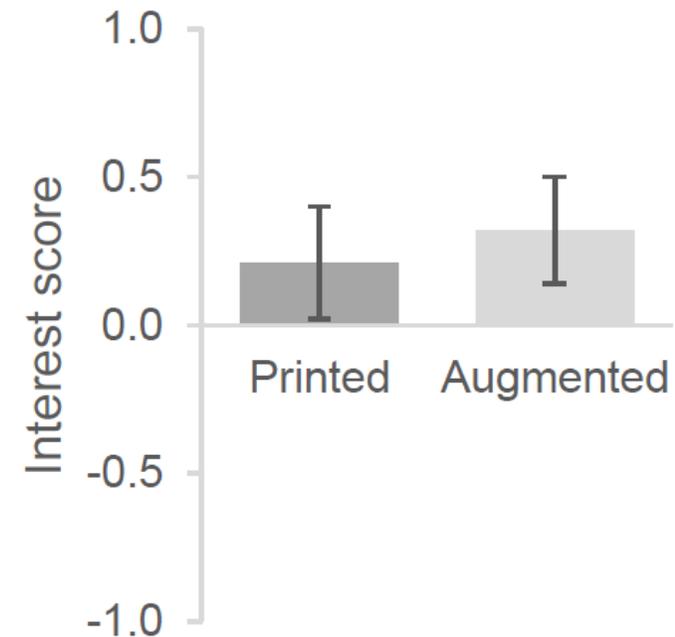

Ease of spatial orientation

N = 2 x 28

## Evaluation: Thematic interest (H2)

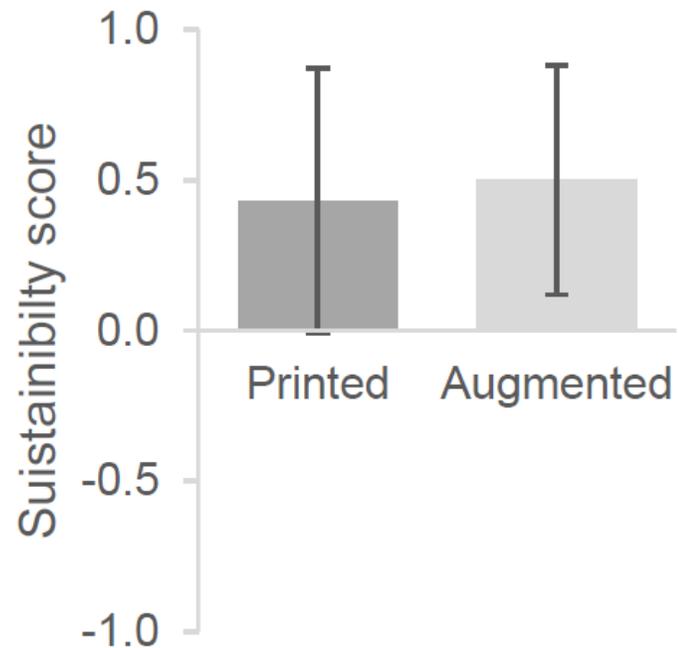

Effectiveness of map interpretation

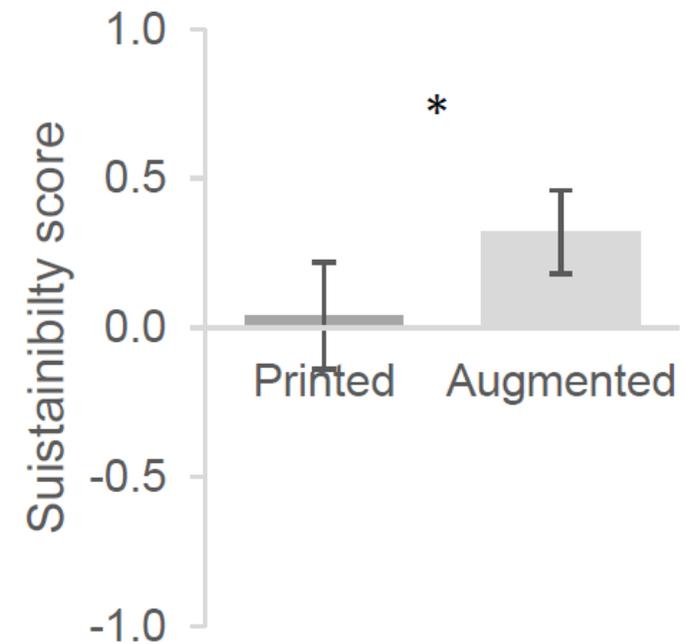

Interest in map topic

N = 2 x 14

## Evaluation: Sustainable norms (H3)

Attitude from map judgement

Change of attitude

N = 2 x 14

# Summary

- We succeeded in implementing a functional prototype.
  - The results of all assessment tasks (i.e. analysis, interpretation, judgement) and students' interest in geographic topics did not differ significantly between printed and augmented maps.
  - Students indicated that they could spatially orientate themselves easier with AR and they felt that their attitude was influenced in a more sustainable way.
- All hypotheses have to be rejected, though there is a positive trend towards AR.

# Challenges

Problem	Possible solution
Bent printed atlas sheets	Apply a folded surface model [Martedi 2011]
Limited device storage	Download geodata from a server
Manual upload of image targets to detect natural markers	Place an order for this feature, Swap to another software
Legend placement	Within the user interface, By reference frames [Bleisch 2011]
Fatigueness of users	Assign only short tasks
Jittering of digital objects at steep angles	Improve accuracy by Convolutional Neural Networks [Akgul et al. 2016]

## Future work

- Content presentation
- Coherent design
- Cartographic refinements
- Advanced functionality
- Apply didactical concepts
- Different usability experiments
- Other operating systems

**Abstract:** Digitalization in schools requires a rethinking of teaching materials and methods in all subjects. This upheaval also concerns traditional print media, like school atlases used in geography classes. In this work, we examine the cartographic technological feasibility of extending a printed school atlas with digital content by augmented reality (AR). While previous research rather focused on topographic three-dimensional (3D) maps, our prototypical application for Android tablets complements map sheets of the Swiss World Atlas with thematically related data. We follow a natural marker approach using the AR engine Vuforia and the game engine Unity. We compare two workflows to insert geo-data, being correctly aligned with the map images, into the game engine. Next, the imported data are transformed into partly animated 3D visualizations, such as a dot distribution map, curved lines, pie chart billboards, stacked cuboids, extruded bars, and polygons. Additionally, we implemented legends, elements for temporal and thematic navigation, a screen capture function, and a touch-based feature query for the user interface. We evaluated our prototype in a usability experiment, which showed that secondary school students are as effective, interested, and sustainable with printed as with augmented maps when solving geographic tasks.
